## Non-equilibrium field theory and decay widths: a new golden rule

Motivated by magnetic quantum systems in the regime of finite temperatures and close vicinity to a quantum critical point, we develop a generalisation of the Fermi Golden Rule appropriate to handle the calculation of large decay widths. The 'generalised golden rule' is a self-consistent procedure, and the central results are generic. However, the present study specifically considers an O(3) non-linear field theory;  $\bar{\varphi}^4$  theory, as a toy application of the generalised golden rule. Following this, we directly apply our results to the real quantum antiferromagnet TlCuCl<sub>3</sub>, which is very well described by the O(3) field theory with an anisotropic term. We compare our results to the very recent INS data and find excellent agreement.
